

# Microsoft 365 Backup

Over one million companies rely on Microsoft 365 for their daily business. Emails, messages, documents, and contacts are stored in the cloud. Just because everything is autosaved, doesn't mean data and files are protected.

## Not Backing Up Microsoft 365 Means:

- No protection against data corruption, malware, user error, or malicious intent
- No point-in-time full application consistent historic recovery points
- No simple point-and-click granular recovery of application objects
- No copies of Microsoft 365 data outside of Microsoft's infrastructure

\* after thirty days

Data protection challenges for M365 are the same as those for on-premises data. Not having a secondary backup leaves organizations exposed to risk.

It is an organization's responsibility to protect and manage data, even when it's hosted in the Cloud. Cloud-based replication improves platform availability but does not protect against data loss or corruption.

## Benefits of Bluesource Managed M635 Backup

- Around-the-clock support and service
- Longer-term historic recovery points provide the basis for compliance and governance needs
- Simple item-level recovery of folders and files
- Data reduction technology reduces cloud storage footprint
- Backup and recovery to alternative Azure, other cloud targets, or on-premises
- Self-service portal for end-users to easily recover their data
- Flexible retention for all M365 data sets to meet your compliance, GDPR, and other requirements
- Fully auditable reporting on user operation

# Microsoft 365 Backup

## Secure Your Data with Bluesource

Our fully managed enterprise-grade backup service for Microsoft 365 provides a comprehensive approach to protecting all your cloud data without any complexity.

We have a unified backup and recovery solution for Exchange Online, SharePoint Online, OneDrive for Business, and any other data located on-premises or across multiple cloud environments.

We help store backup copies outside of the Microsoft environment for secure, quick, and simple data recovery from deletion, corruption, or malicious intent. We can even store backup copies within your data centers.

Our end-user portal provides simple access to discover and recover data.

### Do I have a M365 Backup strategy?

If IT doesn't, you're relying on SLAs, processes, and support that haven't been designed specifically for recovering your data.

### Where is existing data hosted?

Data copies are tenanted within the Microsoft environment, rather than discrete copies in a segregated environment.

### How recoverable is M365 data?

In M365, data is replicated. However, true recoverability means having multiple consistent historic point-in-time copies of the data.
